C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kapp capped) in the subunits associate into late hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into late hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into late hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into late hain display.
C;Superfamily: immunoglobulin C region; immunoglobulin homology
C;Superfamily: immunoglobulin C region; jumunoglobulin homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A;Cross-references: GB:M35032; NID:g194478; PIDN:AAA37919.1; PID:g387217
C;Comment: The sequence of residues 1-328 was assumed to be identical with the correspond C;Comment: Cell lines producing IGG contain two mRNA species for Ig gamma chains. The marhat it contains an alternative 3' end, encoded in separate exons, that is homologous with C;Genetics:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A;Note: the sequence was determined from the germline gene R;Yamawaki-Kataoka, Y.; Miyata, T.; Honjo, T. A; Residues: 118-267, 'E',269-328, 'G', 330-334 < DOG>
C; Comment: Lys-335 is removed posttranslationally.
C; Comment: The sequence differs from that of the a allele, from BALB/c mice, at 15% of t C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap) hain disulfide bonds. In some cases, such as IGA and IgM, the subunits associate into la C; Superfamily: immunoglobulin cregion; immunoglobulin homology
C; Keywords: alternative splicing; duplication; glycoprotein; heterotetramer; immunoglobu F; 20-84/Domain: immunoglobulin homology < IM1>
